Emails

Data

File `mails.txt` contains the number of emails received over a period of few weeks. The file is a CSV-like file with 3 fields:

- `date`: the date in format YYYY-MM-DD
- `n_emails`: number of emails received this day
- `weekday`: the name of the day of the week, in French (lundi, mardi, etc)

Notes:

- field separator is ;
- emails are "received" the day when they are downloaded (not sent). A day when emails were not checked at all is indicated with an NA value as n_emails.

Technical hints:

- `as.Date(x)`: convert x (chr) to a real Date, assuming standard format [for date-and-time, use `as.POSIXct()`]
- `factor(x, levels=..., order=TRUE)`: convert x to an ordered factor with given levels
- `lag()`: to refer to the previous observation; ex: `n_eemails - lag(n_emails)`

Feux-Forets

Data

The file `feux-foret.txt` contains all forest fires recorded in Auvergne-Rhône-Alpes during the period 2000–2025. The file is a CSV file (delimiter: tab `\t`) with 5 fields:

- `Année` : year of the fire
- `Département` : number of the department involved
- `PremièreAlerte` : time of the first alert (format YYYY-MM-DD HH:MM:SS)
- `Surface` : area affected (in m^2)
- `Nature` : nature or cause of the fire

Source: https://bdiff.agriculture.gouv.fr/incendies (sept, 3rd, 2026)

Technical Tips

- `as.POSIXct(x)`: Converts to a date-and-time string (if the format is standard)
- `factor(x)`: Converts x to a factor

Temperatures

The Data

The file `temperatures.txt` contains the average temperature in France, month by month, for the period 2000–2026. The file is a CSV file (delimiter: tab `\t`) with 5 fields:

- `Date`: first day of the month in YYYY-MM-DD format
- `Température observée`: (°C)
- `Température moyenne`: (°C)
- `Température maximale`: (°C)
- `Température minimale`: (°C)

The observed temperature is the average across 30 French stations distributed evenly throughout the country. The average, maximum, and minimum temperatures are calculated based on the 1991–2000 reference period.

Source : https://dataclimat.fr/temperature/itn, données au mois, de 01/1990 à 06/2026 (3 sept. 2026)

Technical Tips

- as.Date(x)‘: converts x (a string) to a date (assuming a standard format)
- `lag()`: refers to the previous observation in a dataset
